

FOUR-PAGE TEST DOCUMENT

A sample PDF for layout, text extraction, table, and pagination testing

Document Overview

This document contains a mix of headings, paragraphs, lists, tables, nested table content, special characters, and page-level footers. It is intentionally generic and can be used to check PDF rendering, text extraction, document indexing, or upload workflows.

Test Checklist

- Confirm that the PDF opens and contains exactly four pages.
- Check that headings and paragraph text are searchable/selectable.
- Verify table borders, alignment, and cell wrapping.
- Inspect page numbers and footer placement.
- Try extracting special characters and nested table text.

Sample note: The quick brown fox jumps over the lazy dog. Numbers: 0123456789. Symbols: © ® ™ ± × ÷ → • — ...

1. Text and Formatting

This page provides several paragraphs with different lengths and a short list. A document-processing system may use these elements to test reading order, paragraph boundaries, and text normalization.

Example Paragraphs

A well-structured document uses consistent spacing and clear hierarchy. This paragraph is deliberately moderate in length so that line wrapping can be observed in different PDF viewers.

The second paragraph includes a date (29 September 2026), a decimal (123.45), a ratio (3:2), and a quoted phrase: “Testing should be repeatable.” It also includes an em dash — and an en dash –.

Key Terms

- **Rendering** — Turning document data into a visible page.
- **Extraction** — Converting visible or embedded text into machine-readable text.
- **Pagination** — Dividing content across pages.
- **Metadata** — Properties such as title, author, and creation details.

Compact Data Table

ID	Test item	Expected result	Status
T-01	Text extraction	Text is selectable	Pending
T-02	Page count	4 pages	Pending
T-03	Footer	Page number visible	Pending
T-04	Symbols	Characters render	Pending

2. Tables and Nested Content

The table below includes a nested table inside one cell. This can help test table detection, cell boundaries, and reading order when a PDF parser encounters nested structures.

Group	Description	Nested records	
Group A	Contains two example records.	Sub-ID	Detail
		A1	Alpha item
		A2	Beta item
Group B	No nested table in this row; includes a longer description to test wrapping within a cell.	B1 — Gamma B2 — Delta	

Additional Table Cases

Case	Input	Notes
01	Short	Single-line cell
02	A longer cell with multiple words	Should wrap naturally
03	Mixed: 42 / A-7 / 2026	Numbers and punctuation
04	Blank field	

3. Data, Edge Cases, and Summary

The final page contains a small dataset and a set of edge-case strings. Use these to test copy/paste behavior, text recognition, line wrapping, and punctuation handling.

Sample Dataset

Record	Name	Quantity	Amount (■)	Flag
R-1001	North	12	1,250.00	Yes
R-1002	South	7	875.50	No
R-1003	East	0	0.00	No
R-1004	West	108	12,480.75	Yes

Edge-Case Strings

Case A: Leading zeros — 0000456

Case B: Punctuation — ! ? # % & / \ () [] { }

Case C: Mixed case — lower / UPPER / MiXeD

Case D: Long token — TESTTOKEN_ABCDEFGHIJKLMNOPQRSTUVWXYZ_0123456789

Case E: Unicode — café, naïve, résumé, Ω, ■, ✓, ★

Completion Summary

End of test document. Expected page count: 4. Suggested checks: page count, text extraction, table structure, nested table content, special-character rendering, and footer consistency.
